**PERMEABLE INTERLOCKING CONCRETE PAVEMENT (PICP)**

**DESIGN PROFESSIONALS FACT SHEET**

**PICP Stormwater Benefits**

- Infiltrates, filters and decreases stormwater runoff rate and reduces Total Maximum Daily Load (TMDL)
- LEED® point eligible for Sustainable Sites, Water Efficiency, Materials & Resources and /or Innovative Design; Contributes to Green Globe points
- Meets U.S. Environmental Protection Agency (EPA) stormwater performance criteria as a structural best management practice (BMP) while providing parking, road and pedestrian surfaces
- Helps meet local, state and provincial stormwater drainage design criteria and provides compliance with the U.S. National Pollutant Discharge Elimination System (NPDES) regulations
- Provides 100% pervious surface by runoff passing through small, aggregate-filled openings between solid high-strength durable concrete pavers
- Reduces or eliminates stormwater detention and retention ponds, storm sewers, drainage appurtenances and related costs
- May be used on sloped sites with proper design
- The modular concrete units allow for project phasing; open-graded base and subbase materials are typically available locally.
- Rainwater harvesting: capable of storing water for on-site irrigation or building grey water use
- May be designed with underground stormwater storage systems, over many slower-draining clay soils and in cold climates
- Processes and reduces pollutants from vehicular oil drippings

**Pollutant removal efficiencies**

(Compared to impervious pavement runoff)
- Zinc: 62-88%
- Copper: 50-89%
- Total Suspended Solids: 60-90%
- Total Phosphorous: 65%

**APPLICATION OPPORTUNITIES**

- **Urban:** Office plazas, sidewalk replacement, street tree planting areas, parking lots, parks and outdoor seating areas
- **Suburban:** Parking lots, parks, driveways, parking bays on roadways, subdivision roads and sidewalks
- **Redevelopment Sites:** Parking areas, plazas and public spaces, sidewalks and brownfields

**Attractive**

**Durable**

**Environmentally Compliant**
Permeable Interlocking Concrete Pavement: A Low Impact Development Tool

PICP supports LID Principles

1. Conserve vital ecological and natural resources: trees, streams, wetlands and drainage courses

2. Minimize hydrologic impacts by reducing imperviousness, conserving natural drainage courses, reducing clearing, grading and pipes

3. Maintain pre-development time of concentration for runoff by routing flows to maintain travel times and discharge control

4. Provide runoff storage and infiltration uniformly throughout the landscape with small, on-site decentralized infiltration, detention and retention practices such as permeable pavement, bioretention, rain gardens, open swales and roof gardens

5. Educate the public and property owners on runoff and pollution prevention measures and benefits

Design Software Available

New software from ICPI for permeable pavement incorporates research from a range of university research studies.

Contact ICPI for further information.
Technical Guidelines

- Pavers conform to ASTM C936 in the U.S. or CSA A231.2 in Canada
- Open-graded crushed stone recommended for all aggregates
- Joint filling stone gradation: ASTM No. 8, 87, 89 or 9
- Base gradation: ASTM No. 57
- Subbase gradation: ASTM No. 2, 3 or 4 (railroad ballast)
- Optional geotextile: consult manufacturers for selection
- Soil subgrade: classified per ASTM D2487; tested for permeability per ASTM D3385
- Structural design: ICPI design chart determines minimum base thickness to support pedestrian and vehicular traffic (see references)

Construction Guidelines

Pavers are delivered ready to place, joints filled, compacted and then are ready for traffic.

Construction Checklist

- No compaction of native soil subgrade – excavate and trim native soil
- Geotextile, drainage pipes and overflow vary with design
- Ensure no sediment from equipment-borne mud on aggregates
- Install and compact aggregate subbase and base with standard paving equipment
- Specialty equipment used for screeding bedding layer and for mechanical paver installation
- Mechanical installation equipment accelerates construction; minimum 5,000 sf (500 m²)/machine/day
- Pavers, non-frozen bedding material & base/subbase installable in freezing temperatures over non-frozen soil subgrade
- Paver joints filled with aggregate and compacted
- No curing time – ready to use upon installation; modular construction allows for project phasing
- Specify experienced ICPI contractors with PICP construction, inspection and detailing skills

Base construction uses locally available materials.

Aggregate base and subbase are spread and compacted; pavers are delivered ready to install. After placement, joints and/or openings are filled with small aggregate. Then pavers are compacted.

Mechanical sweeping of fine aggregate into paver joints

Curve Number and Rational Method Runoff Coefficients

NRCS Curve Numbers (CN) and Rational Method runoff coefficients ('C' value) used depend on the soil infiltration rate, base storage and design storm. In every case, PICP yields significantly lower CN and C values than impervious pavement per the table below:

<table>
<thead>
<tr>
<th>Land Cover</th>
<th>Infiltration Rates</th>
<th>Curve Number CN</th>
<th>Runoff Coefficient, C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permeable Interlocking Concrete Pavement</td>
<td>Up to 50 in./hr (1270 mm/hr) with maintenance</td>
<td>45 - 80</td>
<td>0.00 - 0.30</td>
</tr>
<tr>
<td>3-4 in./hr (75-100 mm/hr) with no maintenance</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Impervious Asphalt or Concrete Pavement</td>
<td>0 in./hr (0 mm/hr)</td>
<td>95 - 98</td>
<td>0.90 - 0.95</td>
</tr>
</tbody>
</table>
Volume Reduction

Research has demonstrated that PICP can reduce runoff as much as 100% from a 3 in. (75 mm) rain event with sandy soil and a minimum 12 in. (300 mm) thick open-graded aggregate base.

Given regional variations in annual rainstorms and PICP base storage capacities, PICP can reduce annual runoff between 30% and 80%. Well-maintained PICP can reduce flows by 70% to 90% from intense rain events and up to 100% for many storms. This yields a corresponding reduction in runoff pollution.

Peak Flow Reduction and Delay

PICP can reduce peak flow by as much as 89%, producing a hydrograph nearer to pre-development conditions. Peak flow is generally proportional to rainfall intensity. Permeable pavers delay the timing of peak flow runoff from several hours to several days.

Additional Benefits

- ADA compliant for slip resistance
- Concrete pavers available in various shapes and colors from local ICPI members; colored pavers mark lanes and parking spaces
- Simplifies surface and subsurface repairs by reinstating the same paving units; no unsightly patches or weakened pavement cuts

Water Quality Improvement

PICP treats stormwater by slowing runoff velocities to allow for sedimentation and filtering by aggregates in the surface openings and base. Oils adhere to small soil particles and aggregates and then are digested by bacteria.

FAQS

Can PICP be used on clay soils? Yes. Even in clay soils, PICP reduces runoff and helps to capture "first flush" runoff and reduce pollution.

Can PICP be used to replace conventional stormwater management tools such as detention basins? Yes. In both colder and warmer climates, PICP has been used to reduce or eliminate the need for conventional stormwater pipe infrastructure, detention basins and drop inlets.

Is Maintaining PICP difficult? No. PICP can be maintained through street sweeping and vacuuming based on a periodic inspection.

Can PICP be used in cold climates? Yes, PICP has been very successful in many Canadian and northern United States applications. It remains stable through freezing and thawing cycles.
